

## ADTD Rugged Lap Top Computer

The ADTD is a rugged, windows-based laptop computer used to transfer data, such as mission plans, navigational aids and communications data, to and from the aircraft avionics system. The system will also be used by loadmasters to compute weight and balance calculations. It can operate at temperatures as low as minus 40 degrees and as high as 140 degrees Fahrenheit. It is also constructed to handle the shock and vibration of a rugged environment. The ADTD will be mounted at the loadmaster station, but is removable and can provide the standard computer tools found on any laptop.
